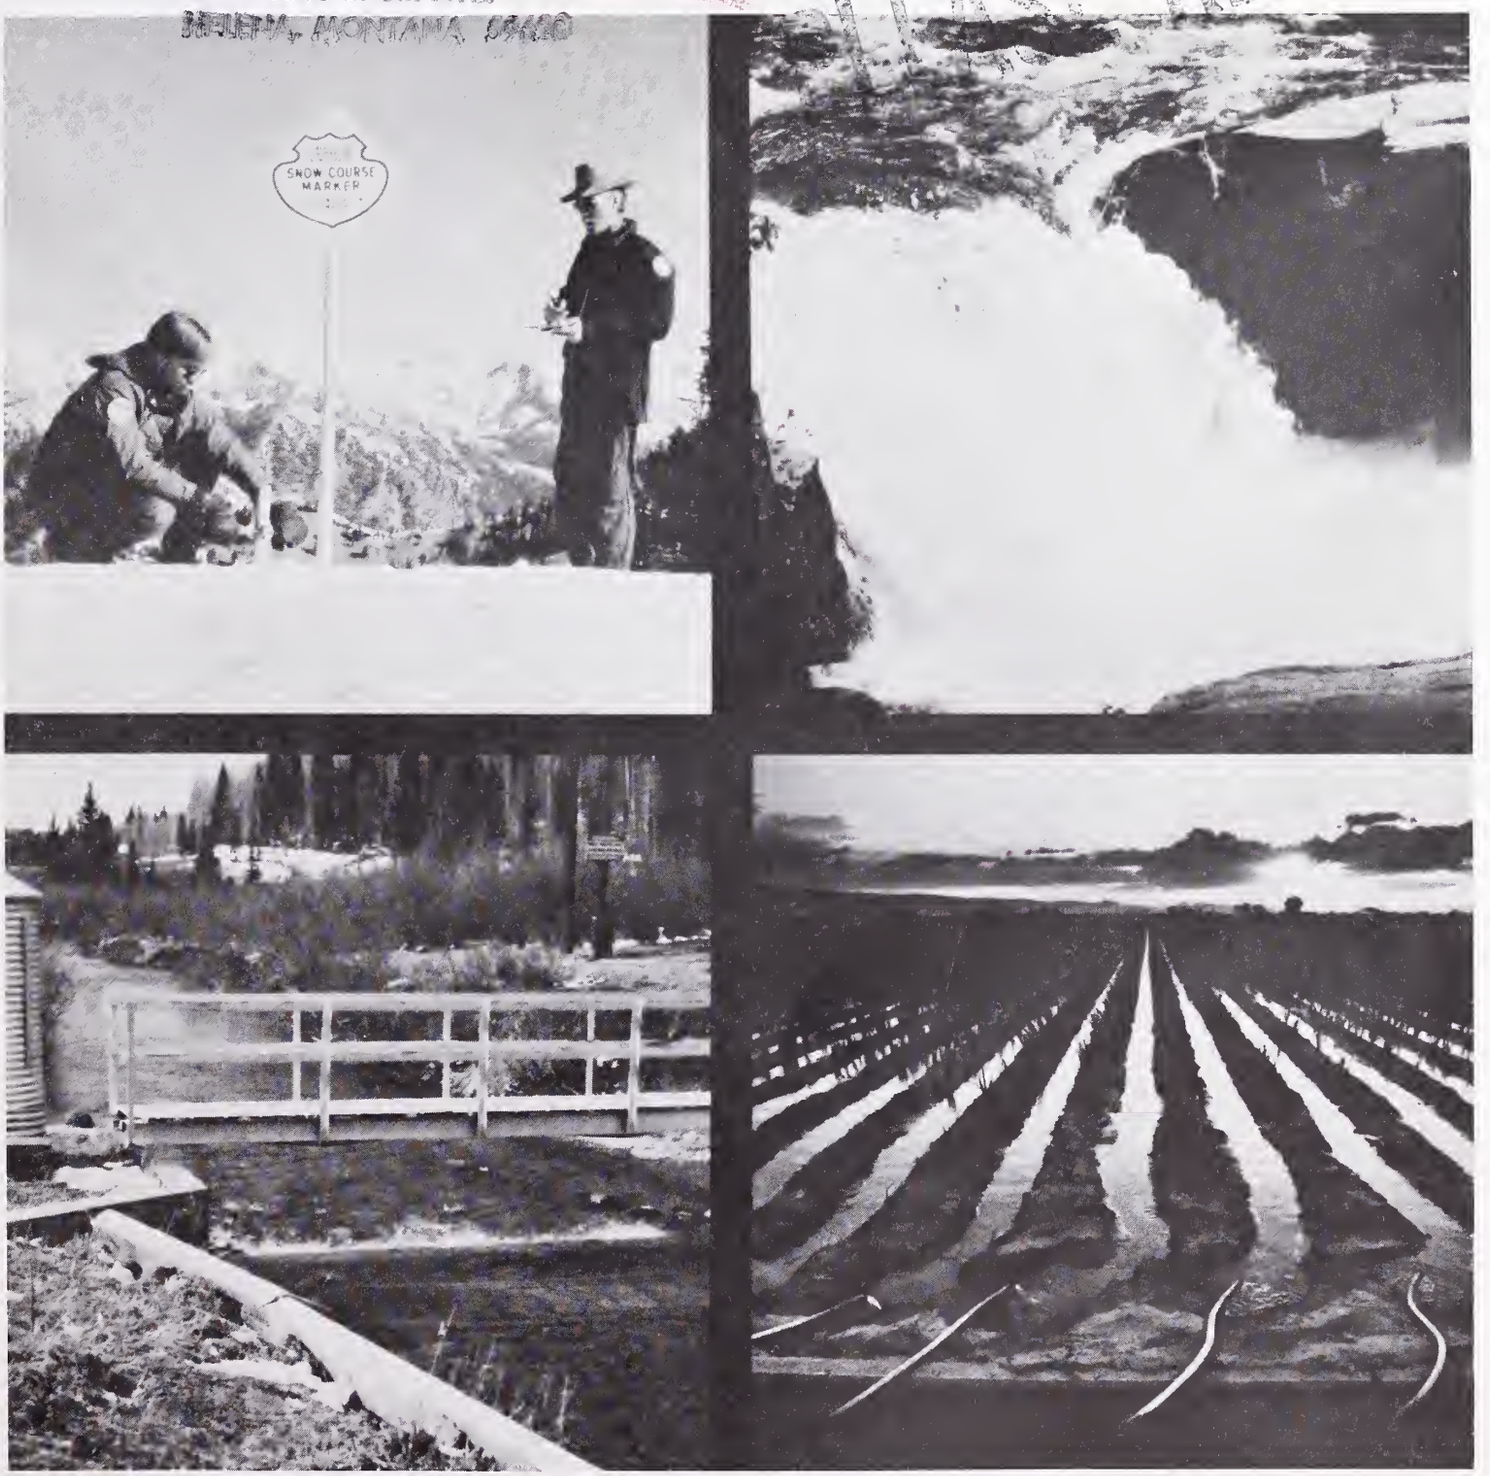
Montana
Water Supply Outlook

January 1, 1988



Foreword

How Forecasts Are Made

Most of the annual streamflow in the Western United States originates as snowfall. This snowfall accumulates high in the mountains during winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when it melts. Predictions are based on careful measurements of snow water equivalent at selected index points. Precipitation, temperature, soil moisture and antecedent streamflow data are viewed in conjunction with snowpack data to prepare runoff forecasts. This report presents a comprehensive picture of water supply outlook conditions for areas dependent upon surface runoff. It includes selected streamflow forecasts, summarized snowpack and precipitation data, reservoir storage data and narratives describing current conditions.

Streamflow forecasts are cooperatively generated by Soil Conservation Service and National Weather Service hydrologists. Forecasts become more accurate as more data affecting runoff becomes known. For this reason, forecasts are issued that reflect three future precipitation conditions — Below Normal, Average, and Above Normal. These forecasts are terms reasonable minimum, most probable, and reasonable maximum. Actual streamflow can be expected to fall between the lower and upper forecast values eight out of ten years.

Snowpack data are obtained by using a combination of manual and automated measurement methods. Manual readings of snow depth and water equivalent are taken at locations called snow courses on a monthly or semi-monthly schedule during the winter. In addition, snow water equivalent, precipitation, temperature, and other parameters are monitored on a daily basis and transmitted via radio telemetry to central data collection facilities. Both monthly and daily data are used to project snowmelt runoff.

For More Information

Copies of Monthly Water Supply Outlook Reports and other reports may be obtained from the states listed below. An annual snow survey data summary is published by the Soil Conservation Service for each of the western states. Historical snow survey data may be obtained at those same offices.

STATE	ADDRESS
Alaska	201 East 9th Ave., Suite 300, Anchorage, AK 99501-3687
Arizona	201 East Indianola, Suite 200, Phoenix, AZ 85012
Colorado	2490 West 26th Ave., Denver, CO 80211
New Mexico	517 Gold Ave. S.W., Room 3301, Albuquerque, NM 87102-3157
Idaho	304 North 8th Street, Room 345, Boise, ID 83702
Montana	10 East Babcock, Room 443, Federal Building, Bozeman, MT 59715
Nevada	1201 Terminal Way, Room 219, Reno, NV 89502
Oregon	1220 Southwest 3rd Ave., Room 1640, Portland, OR 97204
Utah	4402 Federal Building, 125 South State Street, Salt Lake City, UT 84147
Washington	360 U.S. Court House, Spokane, WA 99201-1080
Wyoming	Federal Building, 100 East "B" Street, Casper, WY 82601

In addition to state reports, a Water Supply Outlook for the Western United States is published by the Soil Conservation Service and National Weather Service monthly, January through May. Reports may be obtained from the Soil Conservation Service, West National Technical Center, 511 Northwest Broadway, Room 248, Portland, OR 97209.

GENERAL OUTLOOK

SUMMARY:

The fall started out dry and moisture levels have continued to be below average. Over the last three months, mountain precipitation has been only 50 to 60 percent of average over most of the state. Snowpack on January 1 varies from 35 to 65 percent of average with most areas reporting about one-half of average accumulated water content in the snow. With soils being dry under the snowpack, below average runoff is forecast for all drainages even if precipitation amounts over the next seven months are near average.

SNOWPACK:

Most drainages have only about one-half the average amount of water stored in the snowpack. Snow density is less than normal due to cold temperatures and a late beginning of snow accumulation. Usually snow begins to accumulate in late September to mid-October. This year in most areas, accumulation started near mid-November. By January 1, around 43 percent of the season's snowpack has accumulated.

PRECIPITATION:

October and the first half of November were quite dry across most Montana mountains. Precipitation intensity has increased somewhat since mid-November but is still not up to average levels in mountain areas. Moisture during December was generally 70 to 80 percent of average. Since October 1, total precipitation accumulation has been about 50 percent of average in most areas.

RESERVOIRS:

Most irrigation reservoirs in Central Montana and a few others have below average storage. However, most have near or above average storages for this time of year. Larger multipurpose reservoirs have near or above average storage except for Hungry Horse, Flathead Lake and Canyon Ferry. Reservoir inflows have been below average since the end of the irrigation season and have prevented reservoirs from refilling at normal rates. The prospects of low inflows next spring could impact filling some reservoirs.

STREAMFLOW:

Based on current snowpack, soil moisture levels, and assuming that spring and summer precipitation will be near average, most forecasts indicate spring and summer runoff to be in the 65 to 85 percent of average range. Since less than one-half of the snow accumulation season has passed, these estimates will be significantly influenced by moisture patterns over the next few months.

SOIL MOISTURE:

A dry fall across the entire state has resulted in mountain soil moisture levels much lower than normal. Next spring, some of the snowmelt water will be required to recharge these dry soils before any runoff can occur.

WATER SUPPLY OUTLOOK:

Mountain precipitation has been below average since October 1. However, December moisture was a little better. So far this season, the amount of snow water accumulated on mountain watersheds is about one-half of the average expected by this time of year. Soils under the snowpack are drier than normal. Spring and summer streamflows are forecast to be below normal even if precipitation is near average over the next seven months.

WATER SUPPLY OUTLOOK:

Precipitation over the mountain watersheds has been below average for the past few months. Since October 1, the moisture has been only about one-half of average. December was a little better than previous months but only about 70 percent of average. Current snowpack has only one-half the amount of stored water normally expected by this time of year. Soils under the snow are drier than usual. Spring and summer streamflow is expected to be below average assuming mountain precipitation is near average over the next seven months.

WATER SUPPLY OUTLOOK:

Mountain precipitation during December was about 90 percent of average. But since October 1, the total amount is only about 60 percent of average. Soils under the snowpack are drier than normal as a result of a dry fall. The snowpack is about 60 percent of average over most of the drainage. The Boulder River drainage is a little lower with snowpacks being about one-half of average. Streamflow during spring and summer months is forecast to be below average assuming near average precipitation over the next seven months.

WATER SUPPLY OUTLOOK:

Since October 1, the total amount of mountain precipitation is about 60 percent of average. December received more moisture than the past three months but was still only about 85 percent of average. Snowpack above Hebgen Lake is about 65 percent of average. While in the Madison, Gravelly and Tobacco Root Ranges, snow is about 55 percent of average. Under the snowpack, soils are drier than usual. Streamflow is forecast to be below average during spring and summer months even if precipitation is about average over the next seven months.

For more information contact your local Soil Conservation Service office.

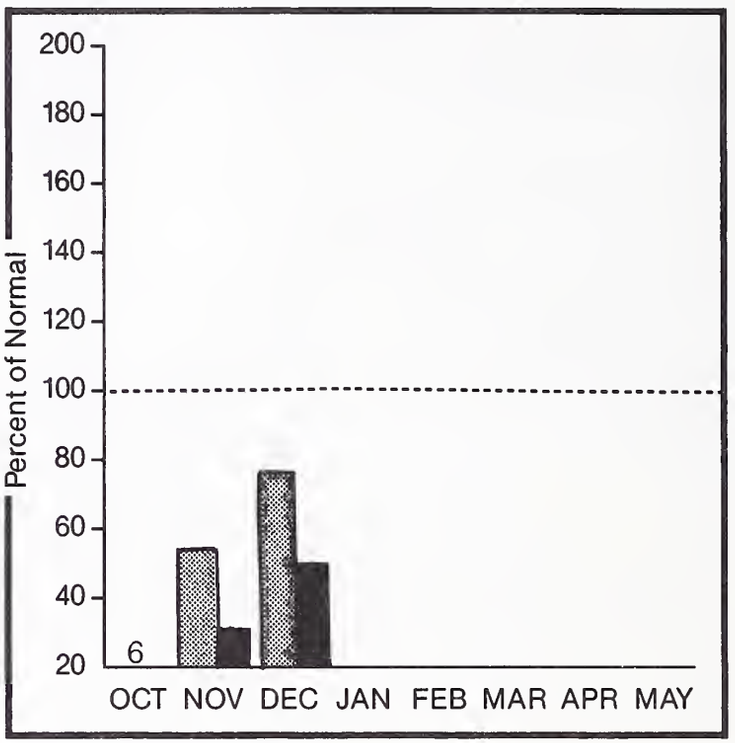
Precipitation* (percent of normal)



*Based on selected stations

Monthly precipitation
Year to date precipitation

WATER SUPPLY OUTLOOK:

Mountain precipitation was about 75 percent of average for December. Total precipitation since October 1 was about 50 percent of average. Snowpack in the Gallatin and Madison Ranges is about one-half of average and a little lower in the Bridger Range and the mountains south of Bozeman. Soils under the snowpack are drier than usual due to a dry fall. Spring and summer streamflow is forecast to be below average based on current snowpack and assuming near average precipitation through July.

For more information contact your local Soil Conservation Service office.

Monthly precipitation

Year to date precipitation

WATER SUPPLY OUTLOOK:

Mountain precipitation for December was 75 to 80 percent of average over the drainage. The total amount of moisture accumulated since October 1 is about 45 percent of average. Due to the very dry fall, soils under the snowpack are drier than normal. Most drainages have 45 to 50 percent of average snowpack except the Shields River which has about 35 percent of average. Based on current snowpack, low soil moisture, and average precipitation for the next seven months, spring and summer streamflows are forecast to be below average.

The Following Organizations Cooperate With The Soil Conservation Service In Snow Survey Work

Canadian

Department of the Environment
- Atmospheric Environment Service
- Water Management Service

British Columbia Ministry of Environment
- Inventory and Engineering Branch, Hydrology Section

Alberta Environment
- Technical Services Division

Federal

U.S. Department of Agriculture
- Forest Service

U.S. Department of the Army
- Corps of Engineers

U.S. Department of Commerce
- NOAA, National Weather Service
- National Environmental Satellite Service

U.S. Department of the Interior
- Bureau of Indian Affairs
- Fish and Wildlife Service
- Geological Survey
- National Park Service
- Bureau of Reclamation

U.S. Department of Energy
- Bonneville Power Administration

State

Montana Conservation Districts
Montana Department of Fish, Wildlife, and Parks
Montana Department of Natural Resources and Conservation
Montana Department of State Lands
Montana State University - Agricultural Experiment Station
University of Montana - School of Forestry

Private

Big Sky of Montana
Butte Water Company
Confererated Salish & Kootenai Tribes
Flathead Valley Comminity College
Montana Power Company
Pondera County Canal & Reservoir Company

Other organizations and individuals furnish information for the snow survey reports.
Their cooperation is gratefully acknowledged.
